RMC Plus

Our hybrid design maintains the system management locally while leveraging the flexibility of cloud. This architecture delivers complete control of your system from anywhere via any smart or mobile device

The key to this design is the systems administrator's ability to have 100% control of the platform locally as well through the cloud.

If cloud is not accessible the administrator has local control to manage and make changes. Both approaches provide seamless management of single or multiple sites as a unified platform. RMC Plus leverages the WAN to connect all the primary hardware.

RMC Plus provides secure remote system management, remote update, secure backups and seamless third-party integrations.

Our core focus: simplicity, ease of use, and the convergence of multiple technologies within a single, unified platform.

- The brains of the system is embedded locally with a hybrid option for administration locally or via the cloud.
- Database is automatically backed via the cloud
- Automatic updates
- Single and Multi-site management - partition the sites while maintain central management
- Two Factor authentication
- Single Sign on
- Push Notifications
- Mobile App Management
- Mobile Credentials
